

#If someone wants to access efs data(mumbai) to another region(suppose singapore):

1)Create one efs in singapore

2)Select that efs-> view details -> replication -> replication to excisting file system -> select region -> brows efs(select efs which is created in singapore)-> create replication (note: disable the protection)

For replication atleast 20 min required till replication state enables.

3)create one instance in Singapore(in security group add ssh, all traffic and NFS and name it)

4)in Singapore efs -> select replicated efs -> view details -> networks -> manage-> add security group which we created while creating Singapore instance-> save.

5)open Singapore instance in terminal

```
sudo su -
```

```
rpmquery nfs-utils
```

```
mkdir /nfs-singapore
```

(go to singapore efs->select efs->view details->attach->select availability zone where we created our Singapore instance and copy url)

```
(copy url Singapore efs) /nfs-singapore/
```

```
cd /nfs-singapore/
```

```
ll
```

```
df -h
```
